

To whom it may concern:

January 12, 2015

Our company, Formosa Plastics Marine Corporation, has applied Vicmar's washing system for air coolers and turbochargers on over 60 vessels. We are very pleased with the system performance: it maintains the air coolers very clean " as a brand new " condition and after the installation of Vicmar's washing system there is no need to remove air coolers for cleaning during the operation, or even during the dry-dock periods, which definitely means a big saving for the company.

And the most importantly, the engines performance has been improved. Chief Engineers are confirming, that washing systems are maintaining the differential air pressure across the air coolers at the same level, it does not increase. During 16 years of using the Vicmar's washing system no negative effects has been observed.

We definitely recommend to all shipping companies to use Vicmar's washing system in order to improve their engines performance. System is proven by our company during long period of time to be very reliable, simple in operation and very, very effective.

M.C. Liu,

Manager, Marine Engineering Dept.
