To whom it may concern:

Vicmar's on-line cleaning system for turbochargers and air coolers has been used by our company for main and auxiliary engines in our vessels.

We are very pleased to confirm, that this system is very reliable, simple in operation and the system's performance is just excellent: it maintains the turbochargers and air coolers in absolutely clean "as brand new" condition. As a result of this it allows to maintain the constant pressure drop across the air coolers, there is no more deposits build up inside the air coolers and therefore there is no restriction of the air flow to the engine's cylinders. This in turn results in the following:

- **better combustion;**
- **lower exhaust gas temperatures;**
- **reduction of fuel consumption;**

These are very important improvements for the engine performance and for us, as a ship owners. In addition to the above, we also would like to mention, that due to the fact, that air coolers are maintained in very clean condition for very long period of time, it is not necessary to remove air coolers every drydock for cleaning a shore, which is additional saving in maintenance cost.

We are definitely would recommend Vicmar's on-line cleaning system to any shipping company, who would like to improve diesel engines performance and at the same time significantly reduce operational costs by reducing fuel consumption and saving in maintenance cost.

C.D. Leu,
Senior Manager, Ship Management Department
